Apply $250V_{eff}/350V_p$ by variac to roof wire 1 and any wire 0 and measure the magnitude and polarity of the output of the primary voltage transformer for both bogies as per the procedure specified and suggested by the traction converter manufacturer. Primary voltage measurement converters (Pos. 224.1/*) & catenary voltmeter (Pos. 74/*)

This test is to be done for each converter.

Activate cab in driving mode and supply $200V_{RMS}$ through variac to wire no 1501 and 1502. Monitor the following parameters through Diagnostic tool and in catenary voltmeter.

|---|---|---|---|---|
| SLG1_G 87-XUPrim | 25kV | 250% | 25 kV | 250% |
| SLG2_G 87-XUPrim | 25 kV | 250% | 25 kV | 250% |

Decrease the supply voltage below 140 $V_{RMS}$. VCB must open at this voltage. In this case the readings in Diagnostic Tool and catenary voltmeter will be as follows.

| Signal name | Prescribed value in catenary voltmeter | Prescribed value in Micview | Monitored value in catenary voltmeter | Monitored value in SR diagnostic tool |

### 5. Battery power ON

***Tests* Supply Voltages**

Remove all Control cable connectors (Analog and Digital Input/output connectors) from HLC1, HLC2. While Switch ON Battery supply observe is there any MCBs tripping. Wait for one or two minutes after switching ON Circuit breaker(MCB1) and observe for any overheating symptoms like smell, smoke, temperature etc. from the wire bunches. If any such symptoms are noticed, there might be a short circuit in the wire bunch. Check up once again continuity wherever suspected. After that check the Voltage levels at all equipments connectors as mentioned below.

| Test Details | Acceptance | Observations |
|---|---|---|
| Voltage Level at HLC1 :<br>I. Between wago terminal XF22S:03/54 and XF22S:03/58<br>II. Between wago terminal XF22S:03/53 and XF22S:03/58 | ~110VDC | OK |
| Voltage Level at HLC2 :<br>I. Between wago terminal XF77S:03/52 and XF77S:03/56<br>II. Between wago terminal XF77S:03/51 and XF77S:03/56 | ~110VDC | OK |

**Note:** After Above tests switch off the Power and restore all removed connectors and once again switch ON the 110 V Supply and ensure that no MCB tripping due to abnormality.

## 6. Converter operation (ON/OFF) test

Power supply is directly available to the Hotel Load Converter via Hotel Load Converter winding (2UH1-2VH1) and (2UH2-2VH2). As soon as BLDJ is closed power will be available to the Hotel Load Converter. Connect the test jig of Hotel Load Converter to the UIC and IV Coupler. Charge the locomotive and switch on the BLHO, LSHO indication should glow. Hotel Load Converter screen will show message "waiting for ON command". One by one Hotel Load Converter can be switched on by test jig. Finally both the Hotel Load Converter should be turned out simultaneously. Observe the flow of air from the air duct, this will ensure that Hotel Load Converter is ON. Both the Hotel Load Converters are ON, then voltage and frequency should be measured as per the table below:-

**Converters should run without any irregularities.**

| Hotel Load Converter 1 | | | |
|---|---|---|---|
| Output Voltage | | | Output Frequency (Hz) |
| U-V | V-W | U-W | |
| OK | OK | OK | OK |

| Hotel Load Converter 2 | | | |
|---|---|---|---|
| Output Voltage | | | Output Frequency (Hz) |
| U-V | V-W | U-W | |
| OK | OK | OK | OK |

## 7. Earth Fault Test

**7.1 Input Earth Fault:**-Ground the input terminal of the Hotel Load Converter using a proper resistance and then turn on the Hotel Load Converter. The converter should trip with the message "Input earth fault".

**7.2 Output Earth Fault:**-Ground the output terminal of the Hotel Load Converter using a proper resistance and then turn on the Hotel Load Converter. The converter should trip with the message "Output earth fault".

**Note:** These to be done for the both the converters (HLC1 and HLC2) separately.
