Page: 6 of 27

Make sure that the earthing brush device don't make direct contact with the axle housing, earth connection must go by brushes.

2.2 Check Points

Items to be checked	Remarks
Check whether all the earthing connection in roof and machine room as mentioned in sheet no. 22A is done properly or not. These earthing connections must be flexible and should be	cheeked or
marked yellow & green Check whether all the earthing connection between loco body and bogie is done properly or not. These cables must be flexible having correct length and cross section	Cherked Ol

2.3 Low Tension Test Battery Circuits (without control electronics)

These tests are done with the help of the special type test loop boxes as per procedure given in Para 3.6 of the document no. 3 EHX 610 279

Page: 12 of 27

Primary Voltage Transformer 4.3

Apply $250V_{\text{eff}}/350V_{\text{p}}$ by variac to roof wire 1 and any wire 0 and measure the magnitude and polarity of the output of the primary voltage transformer for both bogies as per the procedure specified and suggested by the traction converter manufacturer. Primary voltage measurement converters (Pos. 224.1/*) & catenary voltmeter (Pos. 74/*)

This test is to be done for each converter.

Activate cab in driving mode and supply $200V_{RMS}$ through variac to wire no 1501 and 1502. Monitor the following parameters through Diagnostic tool and in catenary voltmeter.

Signal name	Prescribed value in catenary voltmeter	Prescribed value in Micview	Monitored value in catenary voltmeter	Monitored value in SR diagnostic tool
OLG OF VIIDnim	25kV	250%	25KV	2507
SLG1_G 87-XUPrim		250%	25 X V	250/-
SLG2 G 87-XUPrim	25 kV	23070	23 0	

Decrease the supply voltage below 140 V_{RMS} . VCB must open at this voltage. In this case the readings in Diagnostic Tool and catenary voltmeter will be as follows.

Signal name	Prescribed value in catenary voltmeter	Prescribed value in Micview	Monitored value in catenary voltmeter	Monitored value in SR diagnostic tool
SLG1 G 87-XUPrim	17kV	170%	17KV	170-5
SLG2 G 87-XUPrim	17 kV	170%	17KV	1704.

Reactivate VCB to on by increasing this voltage to 175% (17.5 kV).

Increase the supply to 240 V_{RMS} through variac. VCB must open at this voltage, In this case the readings in diagnostic tool and catenary voltmeter will be as follows:

Signal name	Prescribed value in catenary voltmeter	Prescribed value in Micview	Monitored value in catenary voltmeter	Monitored value in SR diagnostic tool
av Cl. C. 97 VIID.	30kV	300%	30KV	300%
SLG1_G 87-XUPrim		2000/	30KV	300%
SLG2_G 87-XUPrim	30 kV	300%	3000	307

Reactivate VCB to on by decreasing this voltage to 290% (29 kV).

4.7 Test DC Link Voltage Sensors (Pos 15.6/*)

This test is to be done by the commissioning engineer of the firm if required.

4.8 Verification of Converter Protection Circuits (Hardware limits) -

This test is to be done as per para 6.17 of the document no. 3EHX 610 282 for both the converters.

Protection circuits	Limit on which shutdown should take place	Measured limit
Current sensors (Pos 18.2/1, 18.2/2, 18.2/3, 18.4/4, 18.5/1, 18.5/2, 18.5/3) for Power Converter 1	Increase the current quickly in the test winding of the current sensors, VCB will off at 2.52A with priority 1 fault for each sensor. 5.1 Check List

tems to be checked	Yes/No
	Yey
ibre optic cables connected correctly.	
No rubbish in machine room, on the roof, under the loco.	Yey
All the electronic Sub-D and connectors connected	Tes
All the MCBs of the HB1 & HB2 open.	109
All the three fuses 40/* of the auxiliary converters	Yes
The fuse of the 415/110V auxiliary circuit (in HB1) open.	Yey
Roof to roof earthing and roof to cab earthing done	tes
Fixing, connection and earthing in the surge arrestor done correctly.	Yes
Connection in all the traction motors done correctly.	Yes
All the bogie body connection and earthing connection done correctly.	Yes
Pulse generator (Pos. 94.1) connection done correctly.	Yey
All the oil cocks of the gate valve of the transformer in open condition.	Ky
All covers on Aux & Power converters, Filter block, HB1, HB2 fitted	res
KABA key interlocking system.	TR

5.2 Safety test main circuit breaker

Prepare to switch off the catenary supply during the first charging of the locomotive in case of any unexpected behavior of the electrical component of the loco. Charge the loco for the first time by closing BLDJ switch. The VCB will trip after certain time as no oil/coolant pumps are running yet.

Perform the following safety test of main circuit breaker through both the cabs of the locomotive.

5.3 Auxiliary Converter Commissioning

Switch on the high voltage supply and set up the loco in driving mode. Raise the panto. Close the VCB. Check that there is no earth fault in the auxiliary circuit, Switch off the VCB. Lower the panto. Create the earth fault in auxiliary circuit by making connection between wire no 1117(in HB2 cubicle) and earth. After 3 minutes a diagnostic message will come that "Earth fault auxiliary circuit."

5.3.1 Running test of 3 ph. auxiliary equipments

Switch on the 3 ph. auxiliary equipment one by one. Check the direction of rotation of each auxiliary machine and measure the continuous current and starting current drawn by them.

Name of the auxiliary machine	Typical phase current	Measured continuous phase current	Measured starting phase current

For WAP-7 locomotive with Hotel load converter refer to Annexure-HLC

5.6 Traction Converter Commissioning

This test is carried out in association with Firm.

Traction converter commissioning is being done one at a time. For testing Converter 1, switch off the traction converter 2 by switch bogie cut out switch 154. For testing Converter 2, switch off the traction converter 2 by switch bogie cut out switch 154. Isolate the harmonic filter also by switch 160. Start up the loco by one converter. Follow the functionality tests.

NA
ith park brake in applied condition.
ith direct loco brake applied (BP< 4.75Kg/cm²).
ith automatic train brake applied (BP<4.75Kg/cm ²).
ith emergency cock (BP < 4.75 Kg/cm ²).
ritch of the brake electronics. The
active /Braking effort should ramp down, VCB
ould open and BP reduces rapidly.
ing the TE/BE throttle to BE side. Loco speed
ould start reducing.
the event of failure of one BUR, rest of the two
JRs can take the load of all the auxiliaries. For this
vitch off one BUR.
uxiliaries should be catered by rest of two BURs.
witch off the 2 BURs; loco should trip in this case.
ff the electronics. VCB should open and converter
II the electronics, vos site and
hould get isolated and traction is possible with
)
